MANAGEMENT OF ADULTS WITH MILD COVID-19

**MANAGING RISK OF INFECTION**
- Follow national advice for use of PPE in non-inpatient healthcare settings during the COVID-19 outbreak. [PP (Taskforce/ATIPPC)]
- Manage any person clinically and epidemiologically assessed as being a suspected case of COVID-19 as if they are a confirmed case until they have a negative SARS-CoV-2 PCR test done while symptomatic, and there is an alternative diagnosis or symptoms have resolved, as per [CDNA advice: PP (Taskforce)]

**DETERMINING SETTING OF CARE**
The most appropriate setting will depend on:
- Local public health policies
- Clinical evaluation of the person with COVID-19
- Evaluation of the home setting including capacity for strict infection control
- Ability to monitor for clinical deterioration and the availability of rapid transfer to higher level of care
- Patient preference. [PP (Taskforce/WHO)]

**BASELINE ASSESSMENT**
Check for signs of moderate/severe disease (refer to Assessment for suspected COVID-19 Clinical Flowchart)
Check status of oro/nasopharyngeal swab results.
No baseline investigations are required for mild COVID-19. [PP (Taskforce)]

**COVID-19 THERAPIES**

**SUPPORTIVE CARE**
Manage mild COVID-19 in a similar way to seasonal flu and advise patients to rest. [PP (BMJ)]
An antipyretic is generally not required for mild COVID-19, but paracetamol or ibuprofen as appropriate can be considered for symptomatic relief. [PP (ACSQHC)]

**ANTIBIOTICS**
Do not prescribe antibiotics for mild COVID-19 unless indicated for other reasons, such as community acquired pneumonia. [PP (Taskforce)]

**DISEASE-MODIFYING TREATMENTS**
**NOT RECOMMENDED**
- Hydroxychloroquine
- Lopinavir-ritonavir
- Interferon β-1a

Do not use these medications for the treatment of COVID-19.

**Definition of disease severity**

**Mild illness**
Adults not presenting any clinical features suggestive of moderate or severe disease or a complicated course of illness.
Characteristics:
- no symptoms
- or mild upper respiratory tract symptoms
- or cough, new myalgia or asthma without new shortness of breath or a reduction in oxygen saturation

**Rural and remote access to care**
This flowchart should be applied after considering features of the individual patient, their preferences and the context in terms of rurality/remoteness, public health responses and proximity to higher-level care. Application of the flowchart will vary with local current COVID-19 prevalence and availability of testing. Early transfer to a major centre should be considered for those at risk of deterioration.

**TREATMENT OPTIONS**

**NOT RECOMMENDED**
- Interferon β-1b
- Interferon gamma
- Interferon-kappa + tff2
- Ivermectin
- N-acetylcysteine
- Human umbilical cord mesenchymal stem cells
- Mesenchymal stem cells
- Interferon γ
- Interferon β-1b
- Favipiravir
- Azithromycin

**OTHER TREATMENTS**
- Kolavon
- Ribavirin
- Colchicine
- Hydroxychloroquine (oral, intravenous)
- Hydroxychloroquine plus azithromycin
- Hydroxychloroquine plus methylprednisolone
- Inhaled Interferon β-1a
- Intravenous Immunoglobulin
- Peginterferon lambda
- Recombinant human granulocyte colony-stimulating factor
- Remdesivir

These disease-modifying treatments should still be considered for other evidence-based indications in people who have COVID-19. [PP (Taskforce)]

**DEMOGRAPHIC CONSIDERATIONS**
- Adolescents, pregnant and breastfeeding women, older people living with frailty and those receiving palliative care. Until further evidence is available, do not use other disease-modifying treatments in these populations unless they are eligible to be enrolled in trials. [PP (Taskforce)]
**Follow up care**
- Assist people to connect to a GP if they do not have one.
- When the acute phase of the illness has resolved, and the patient is mobile, undertake a comprehensive review to assess their ongoing and rehabilitation needs.
- Review medications that were stopped or started.

**Release from isolation**
- Refer to relevant State and Territory public health advice for the conditions that must be met prior to release of a person from isolation.
- Review patient Care at Home advice and provide to patient if appropriate.

**THINGS TO WATCH FOR**
Advise the person with COVID-19 and their carer or family members to look out for the development of new or worsening symptoms, especially breathing difficulties which may indicate the development of pneumonia or hypoxaemia.

Reassure the person that 4 out of 5 people with COVID-19 will have a mild illness and will usually recover 2 to 3 weeks after the initial onset of symptoms. If respiratory symptoms do worsen, this is most likely to occur in the 2nd or 3rd week of illness.

For some patients, symptoms may persist for longer than 4 weeks, or new symptoms may develop. The range of potential long term symptoms of COVID-19 is as yet unknown. For patients who present with possible symptoms or signs of pneumonia

Check the person’s wishes regarding transfer, and whether they have an Advanced Care Directive for proceeding with hospital management.

Clarify their SARS-CoV-2 status.

If the person wishes to stay in their place of residence or community-based care, discuss care arrangements with the patient, their carer(s) and family, and the local Public Health Unit. Involve their GP, and local palliative care services if available. Be aware that out-of-hospital care will be dependent on the capacity of carer(s) and family to manage infection risk at home and Public Health directives.

If the person wishes to be admitted to hospital, advise the carer or family member to call an ambulance and to notify the paramedics that the person has suspected or confirmed COVID-19.

**Transfer to hospital**

**Release from isolation**
- Refer to relevant State and Territory public health advice for the conditions that must be met prior to release of a person from isolation.
- Review patient Care at Home advice and provide to patient if appropriate.

**Release from isolation**
- Refer to relevant State and Territory public health advice for the conditions that must be met prior to release of a person from isolation.
- Review patient Care at Home advice and provide to patient if appropriate.

**Monitor**

**Escalation of care**
Transfer the person to hospital if they develop symptoms or signs suggestive of moderate or severe COVID-19, such as:
- symptoms or signs of pneumonia
- severe shortness of breath or difficulty breathing
- blue lips or face
- pain or pressure in the chest
- cold, clammy or pale and mottled skin
- new confusion or fainting
- becoming difficult to rouse
- little or no urine output
- coughing up blood

**Release from isolation**
- Refer to relevant State and Territory public health advice for the conditions that must be met prior to release of a person from isolation.
- Review patient Care at Home advice and provide to patient if appropriate.

**Diabetes and cardiovascular disease**

**Approach**
In people with suspected or confirmed COVID-19, the use of other treatments such as insulin, other diabetes medications, or statins should continue as usual.

**Management**
In people with suspected or confirmed COVID-19, only cease or change the dose of long-term immunosuppressants such as high-dose corticosteroids, chemotherapy, biologics, or disease-modifying anti-rheumatic drugs (DMARDs) on the advice of the treating specialist.

In women with mild or moderate COVID-19, the use of other treatments such as insulin, other diabetes medications, or statins should continue as usual.

**Oestrogen containing therapies**

**Consensus recommendation**
Consider stopping oral menopausal hormone therapy (MHT), also known as hormone replacement therapy (HRT), in women with mild or moderate COVID-19.

Before restarting oral MHT, review the indication for this. If MHT is continued, consider using a transdermal preparation.

In women with mild or moderate COVID-19, manage oestrogen-containing contraception as per usual care.

In women who stop or suspect contraception when they have COVID-19, restart contraception at the time of discharge or when the acute symptoms have resolved.

**Conditions managed with immunosuppressants**

**Approach**
In people with suspected or confirmed COVID-19, only cease or change the dose of long-term immunosuppressants such as high-dose corticosteroids, chemotherapy, biologics, or disease-modifying anti-rheumatic drugs (DMARDs) on the advice of the treating specialist.

In women with mild or moderate COVID-19, the use of other treatments such as insulin, other diabetes medications, or statins should continue as usual.

**Management**
In people with suspected or confirmed COVID-19, only cease or change the dose of long-term immunosuppressants such as high-dose corticosteroids, chemotherapy, biologics, or disease-modifying anti-rheumatic drugs (DMARDs) on the advice of the treating specialist.

In women with mild or moderate COVID-19, the use of other treatments such as insulin, other diabetes medications, or statins should continue as usual.

**Oestrogen containing therapies**
Consensus recommendation
Consider stopping oral menopausal hormone therapy (MHT), also known as hormone replacement therapy (HRT), in women with mild or moderate COVID-19.

Before restarting oral MHT, review the indication for this. If MHT is continued, consider using a transdermal preparation.

In women with mild or moderate COVID-19, manage oestrogen-containing contraception as per usual care.

In women who stop or suspect contraception when they have COVID-19, restart contraception at the time of discharge or when the acute symptoms have resolved.

**Treatments for pre-existing conditions**

**Asthma and COPD**

**Approach**
Use inhaled or oral steroids for the management of people with co-existing asthma or COPD and COVID-19, as you normally would for a viral exacerbation of asthma or COPD. Do not use a nebuliser.

**Management**
In patients with COVID-19 who are receiving ACEIs/ARBs, there is currently no evidence to deviate from usual care and these medications should be continued unless contraindicated.

Stopping these medications abruptly can lead to acute heart failure or unstable blood pressure.

**Diabetes and cardiovascular disease**

**Approach**
In patients with COVID-19 who are receiving ACEIs/ARBs, there is currently no evidence to deviate from usual care and these medications should be continued unless contraindicated.

Stopping these medications abruptly can lead to acute heart failure or unstable blood pressure.

**Management**
In patients with suspected or confirmed COVID-19, the use of other treatments such as insulin, other diabetes medications, or statins should continue as usual.

**General**
Ensure that people with suspected or confirmed COVID-19 continue to receive their usual care for pre-existing conditions.

People taking routine NSAIDs for a chronic condition should continue treatment.

**Follow up care**
- Refer to relevant State and Territory public health advice for the conditions that must be met prior to release of a person from isolation.
- Review patient Care at Home advice and provide to patient if appropriate.

**Transfer to hospital**

Check the person’s wishes regarding transfer, and whether they have an Advanced Care Directive for proceeding with hospital management.

Clarify their SARS-CoV-2 status.

If the person wishes to stay in their place of residence or community-based care, discuss care arrangements with the patient, their carer(s) and family, and the local Public Health Unit. Involve their GP, and local palliative care services if available. Be aware that out-of-hospital care will be dependent on the capacity of carer(s) and family to manage infection risk at home and Public Health directives.

If the person wishes to be admitted to hospital, advise the carer or family member to call an ambulance and to notify the paramedics that the person has suspected or confirmed COVID-19.
